A Calculation of the Complete Downwash in Three Dimensions due to a Rectangular Vortex

By

DORIS E. LEHRIAN, B.Sc.,
of the Aerodynamics Division, N.P.L.

Reports and Memoranda No. 277 I*

March, 1949

Summary.—A calculation of the complete downwash in three dimensions due to a rectangular vortex, is given for the limited range $Z = \pm 4$. The downwash is computed at selected positions, in planes normal to the plane of the vortex; these planes are spaced at even integral multiples of the semi-width of the vortex, measured from the line of symmetry. Values are tabulated for Z in the range (0,4) and a set of graphs is also included for $0 \leq Z \leq 2$; they are to be used in conjunction with the "Tables of Complete Downwash due to a Rectangular Vortex" (R. & M. 2461¹).

1. Introduction.—The complete downwash due to a rectangular vortex is calculated from the Glauert formula²

$$F(X, Y, Z) = \left\{ -\frac{X}{X^2 + Z^2} \left[\frac{Y+1}{\sqrt{[X^2 + (Y+1)^2 + Z^2]}} - \frac{Y-1}{\sqrt{[X^2 + (Y-1)^2 + Z^2]}} \right] \right. \\ - \frac{Y-1}{(Y-1)^2 + Z^2} \left[1 - \frac{X}{\sqrt{[X^2 + (Y-1)^2 + Z^2]}} \right] \\ \left. + \frac{Y+1}{(Y+1)^2 + Z^2} \left[1 - \frac{X}{\sqrt{[X^2 + (Y+1)^2 + Z^2]}} \right] \right\}$$

where the relation between the downwash ω/V due to a vortex of strength $K = 2V y_v$, and the downwash factor F is defined as $F = 2\pi\omega/V$. The co-ordinates X, Y, Z are expressed in terms of y_v , the semi-width of the vortex, where the positive X -axis is upstream and the positive Z -axis downwards.

The presentation of the downwash is simplified by the following characteristics of the function F :—

$$F(X, +Y, Z) = F(X, -Y, Z)$$

$$F(X, Y, +Z) = F(X, Y, -Z).$$

The asymptotes of the function are

$$F(X = +\infty, Y, Z) = 0$$

and

$$F(X = -\infty, Y, Z) = -\frac{2(Y-1)}{(Y-1)^2 + Z^2} + \frac{2(Y+1)}{(Y+1)^2 + Z^2}.$$

*Published with the permission of the Director, National Physical Laboratory.

Also

$$F(+X, Y, Z) + F(-X, Y, Z) = F(X = -\infty, Y, Z).$$

Hence it is only necessary to tabulate the values of $F(X, Y, Z)$ for positive values of X, Y and Z , and the values of $F(X = -\infty, Y, Z)$. To simplify subsequent interpolation the functions $G(Z) = -F(X, Y, Z)$, $C_0 = +F(X = -\infty, Y = 0, Z)$, and $C_y = -F(X = -\infty, Y, Z)$ for $Y > 0$ are tabulated.

The function $F(X, Y = 0, Z)$ is a special case, since $F \rightarrow \infty$ at the position $X = 0$ when $Z \rightarrow 0$. This discontinuity is eliminated by considering the function

$$G'(Z) = \frac{2X}{X^2 + Z^2} \left[1 - \frac{1}{\sqrt{(X^2 + Z^2 + 1)}} \right] - \frac{2}{Z^2 + 1} \left[1 - \frac{X}{\sqrt{(X^2 + Z^2 + 1)}} \right]$$

$$\text{where the downwash factor } F(+X, Y = 0, Z) = -\frac{2X}{X^2 + Z^2} + G'(Z).$$

Thus for values of Z in the range (0,2), values of $G'(Z)$ are computed for $0 \leq X \leq 3.2$ and values of $G(Z)$ for $X \geq 2.6$. For Z in the range (2,4) the function $G(Z)$ is computed for all values of X considered.

2. Range of the Calculation.—The intervals of Z in the range (0,2) are chosen so that linear interpolation gives an error not exceeding 0.001, but the intervals of Z in the range (2,4) are arbitrary and interpolation may give a considerable error. The values of C_0 and C_y are tabulated at intervals suitable for linear interpolation. The functions $G'(Z)$, $G(Z)$, C_0 and C_y are tabulated correct to four decimal places in Tables 1 to 9 for values of X, Y, Z as shown below.

Table	Y	X	Z	Linear Interpolation
1	0	$0 \leq X \leq 3.2$	$Z = 0(0.05)0.3(0.1)2.0$	w.r.t. Z for $G'(Z)$
2		$2.6 \leq X \leq 30$	$0(0.5)2.0$	w.r.t. Z for $G(Z)$
3		$0 \leq X \leq 30$	$2.0(0.1)4.0$	may be inaccurate
		$-\infty$	$0(0.01)2.0(0.05)4.0$	w.r.t. Z for C_0
4	2	$0 \leq X \leq 30$	$Z = 0(0.05)0.3(0.1)2.0$	w.r.t. Z for $G(Z)$
5		$-\infty$	$2.0(0.1)4.0$	may be inaccurate
			$0(0.01)2.0(0.05)4.0$	w.r.t. Z for C_2
6	4	$0 \leq X \leq 30$	$Z^2 = 0(1.0)4.0$	w.r.t. Z^2 for $G(Z)$
7		$-\infty$	$Z = 2.0(1.0)4.0$	may be inaccurate
			$0(0.05)4.0$	w.r.t. Z for C_4
8	6(2)20.	$0 \leq X \leq 30$	$Z = 0 \text{ and } 2.0$	w.r.t. Z^2 for $G(Z)$
9		$-\infty$	$2.0(1.0)4.0$	may be inaccurate
			$0 \text{ to } 4.0$	w.r.t. Z for C_y

The variation between the downwash $-G(Z)$ for $Z \leq 4$ and the downwash for $Z = 0$, is less than 0.001 for all values of X when $Y > 20$, and for $X \geq 15$ when $Y \leq 20$. Hence for all $X \geq 15$ and $Y > 20$ the critical tables (R. & M. 2461¹) for $Z = 0$ are used. When $Y > 20$ the variation in C_y due to Z is also less than 0.001.

3. Subsidiary Tables of Complete Downwash.—The subsidiary downwash factors are presented in a similar manner to the main factors, and they are used when corrector vortices (R. & M. 2591³), which are one-quarter the width of the main vortex, have to be considered. The complete downwash at the position (X, Y, Z) due to a rectangular corrector vortex is $4F(X, Y, Z)$ where X, Y, Z are now co-ordinates in terms of one-quarter the semi-width of the main vortex, i.e., $\frac{1}{4}y_v$.

In general the known co-ordinates are $\frac{1}{4}X$, Y , $\frac{1}{4}Z$; and so values of $-4F(X, Y, Z) = G(\frac{1}{4}X, \frac{1}{4}Z)$ have been tabulated against these quantities. The function $G(\frac{1}{4}X, \frac{1}{4}Z)$ is calculated for values of $\frac{1}{4}Z$ in the range (0,4). For $0 \leq \frac{1}{4}Z \leq 2$, the intervals of $\frac{1}{4}Z$ are suitable for linear interpolation, but for $2 \leq \frac{1}{4}Z \leq 4$, interpolation may be inaccurate. The values of $C_y = -4F(X = -\infty, Y, Z)$ are also calculated at intervals of $\frac{1}{4}Z$ arranged for linear interpolation. The functions G and C_y are tabulated in Tables 10 to 15 for the values of $\frac{1}{4}X$, Y , $\frac{1}{4}Z$ as shown below.

Table	Y	$\frac{1}{4}X$	$\frac{1}{4}Z$	Linear Interpolation
10	13	$0 \leq \frac{1}{4}X \leq 15$	$0(0.25)1.0(1.0)2.0$ $2.0(0.5)4.0$ $0(0.05)4.0$	w.r.t. $\frac{1}{4}Z$ for G may be inaccurate w.r.t. $\frac{1}{4}Z$ for C_{13}
11		$-\infty$	$0(0.05)4.0$	
12	21	$0 \leq \frac{1}{4}X \leq 15$	$0(0.5)1.0(1.0)2.0$ $2.0(1.0)4.0$ $0(0.10)4.0$	w.r.t. $\frac{1}{4}Z$ for G may be inaccurate w.r.t. $\frac{1}{4}Z$ for C_{21}
13		$-\infty$	$0(0.10)4.0$	
14	29(8)53	$0 \leq \frac{1}{4}X \leq 15$	0 and 2.0 2.0 and 4.0	w.r.t. $\frac{1}{4}Z$ for G may be inaccurate
15		$-\infty$	0 to 4.0	w.r.t. $\frac{1}{4}Z$ for C_y

The variation between the downwash $-G(\frac{1}{4}X, \frac{1}{4}Z)$ for $\frac{1}{4}Z \leq 4$ and the downwash for $\frac{1}{4}Z = 0$ is less than 0.001 for all values of $\frac{1}{4}X$ when $Y > 53$, and for $\frac{1}{4}X \geq 10$ when $Y \leq 53$. The variation of C_y is also less than 0.001 for $Y > 53$.

4. Graphs of the Downwash Factors.—A graphical presentation of the factors avoids double interpolation, and if the intervals of Z are arranged for linear interpolation with intervals of X suitable for graphing, then for each value of Y a set of Z curves can be plotted against the X co-ordinate. Because of the great variation of the downwash with Z for the smaller values of X and Y , it is difficult to graph the values concisely and still retain sufficient accuracy.

A set of graphs has only been made for the range $0 \leq Z \leq 2$ (Figs. 1 to 7). The original graphs can be read to an accuracy of 0.001, but the originals of Figs. 1 to 4 are too large to reproduce in this report and the copies included are less than half size. The subsidiary downwash factors are also graphed in Figs. 8 to 10 for the range $0 \leq \frac{1}{4}Z \leq 2$.

5. Conclusion.—The downwash $F(X, Y, Z)$ at a position (X, Y, Z) for values of Z in the range (0,4) is calculated, by using Tables 1 to 9 of this report together with the critical tables (R. & M. 2461¹) for $Z = 0$, as indicated by the following diagram and formulae; the error in the value obtained, when corrected to three decimal places, will not exceed 0.001.

Y	$X < 0$	$0 \leq X \leq 15$	$X > 15$
0(2)20	Find $G(Z)$ for value $ X $, and value C_y	Find $G(Z)$	Use $Z = 0$ tables
22(2)88	Use $Z = 0$ tables	Use $Z = 0$ tables	Use $Z = 0$ tables

When $X \geq 0$

$$(i) \quad X \leq 3, Y = 0, Z \leq 2; \quad F(X, 0, \pm Z) = -G(Z) = -\frac{2X}{X^2 + Z^2} + G'(Z)$$

$$\left. \begin{array}{l} \text{(ii)} \quad X \leq 3, Y = 0, Z > 2 \\ \text{(iii)} \quad X \geq 3, Y = 0, Z \geq 0 \\ \text{(iv)} \quad X \geq 0, Y > 0, Z \geq 0 \end{array} \right\} F(X, \pm Y, \pm Z) = -G(Z)$$

When $X < 0$

- (i) $Y = 0, F(X, \pm Y, \pm Z) = +C_0 + G(Z)$
- (ii) $Y > 0, F(X, \pm Y, \pm Z) = -C_y + G(Z).$

The subsidiary downwash $4F(X, Y, Z)$ for values of $\frac{1}{4}Z$ in the range (0,4) is calculated using Tables 10 to 15 and the critical tables (R. & M. 2461¹) for $Z = 0$ as indicated below; the error in the value obtained, when corrected to three decimal places, will not exceed 0.001.

Y	$\frac{1}{4}X < 0$	$0 \leq \frac{1}{4}X \leq 10$	$\frac{1}{4}X > 10$
13(8)53	Find $G(\frac{1}{4}X, \frac{1}{4}Z)$ for value $ \frac{1}{4}X $, and value C_y	Find $G(\frac{1}{4}X, \frac{1}{4}Z)$	Use $Z = 0$ tables
61(8)173	Use $Z = 0$ tables	Use $Z = 0$ tables	Use $Z = 0$ tables

When $\frac{1}{4}X \geq 0$

$$4F(X, Y, Z) = -G(\frac{1}{4}X, \frac{1}{4}Z).$$

When $\frac{1}{4}X < 0$

$$4F(X, Y, Z) = -C_y + G(\frac{1}{4}X, \frac{1}{4}Z).$$

The downwash for $0 \leq Z \leq 2$ can also be obtained by using Figs. 1 to 7 for the values $Y = 0(2)12$ and the range $0 \leq X \leq 10$, and the critical tables¹ for $Y > 12$ and $X > 10$, but there may then be a considerable error in the third decimal place. The subsidiary downwash for $0 \leq \frac{1}{4}Z \leq 2$ is obtained from Figs. 8 to 10, and from the critical tables (R. & M. 2461¹) for $Y > 53$ and $\frac{1}{4}X > 8$.

Acknowledgement.—The writer wishes to acknowledge the advice given by Mr. V. M. Falkner and Dr. E. T. Goodwin during the preparation of the calculation, and the work undertaken by Misses S. D. Brown, W. M. Tafe and B. M. Skelton in computing and checking the tables.
